

McCoy Creek Watershed (northeastern Oregon): The McCoy Meadows Restoration Project reconnected a channelized part of the creek to its former meandering channel and wet meadow, causing dramatic improvements in water temperature and volume of flow that should help increase salmon populations. Agreements on forest and grazing land management practices and additional restoration will help other parts of the watershed. The project's main partners included private ranch landowners, Indian tribes, a local watershed program, and local, state and federal agencies.

The 12 restoration showcase watersheds were selected for their use of stream corridor restoration technology to improve the community, the environment, and water quality as endorsed in the Clean Water Action Plan. They represent a variety of geographic locations and conditions, a balance of management practice and technical design, strong local, tribal or state leadership, and partnership in stream corridor restoration.
